IV. PRINCIPAL PARTS LOCATION

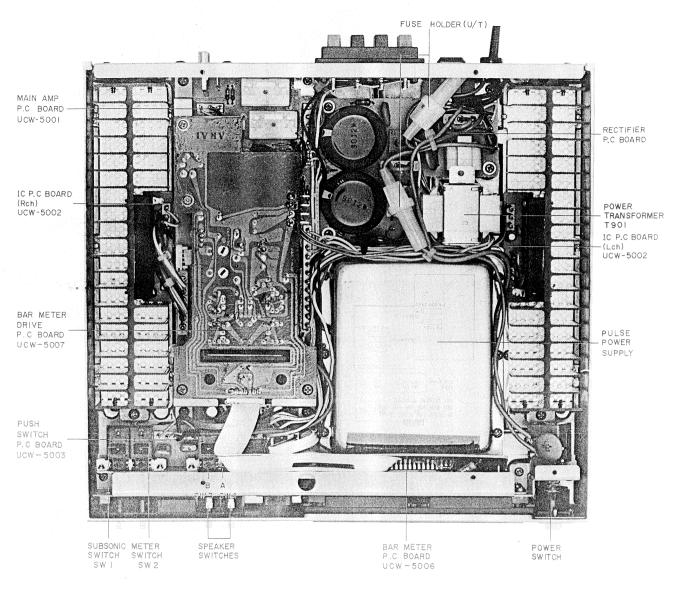

Fig. 2 Rear View

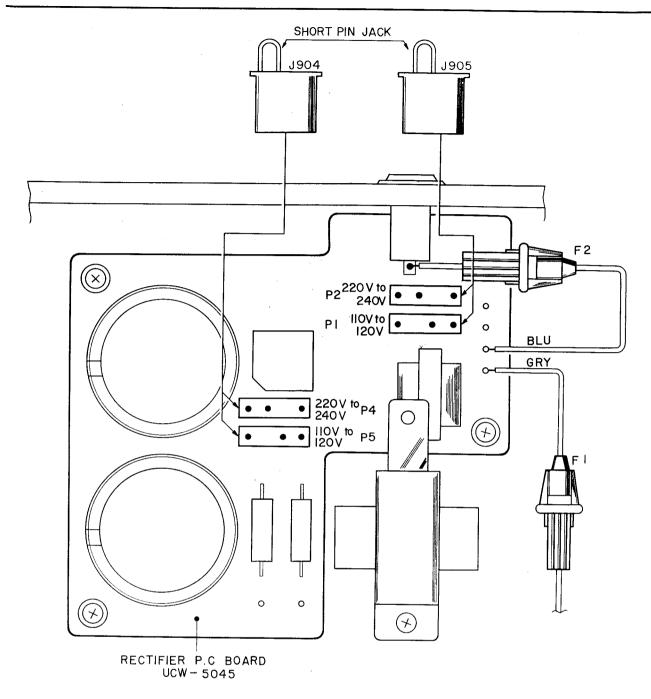

Fig. 3 Voltage Conversion (U/T Model)

1. U/T Model (Refer to Fig. 3)

- 1) Switch OFF the power supply and remove the power cord from the mains supply.
- 2) Loosen the holding screws and remove the bottom panel.
- 3) Insert the short pin jacks J904 and J905 (Refer to Fig. 3).
- 4) Change the fuse (F 1, F 2) : 4 A for 110 V to 120 V and 2 A for 220 V to 240 V.

2. Models other than U/T

No voltage conversion.

VI. OPERATION OF PULSE POWER CIRCUIT

The Pulse Power Circuit is composed of a high-voltage rectifier circuit, oscillator starting circuit, inverter circuit (blocking oscillator circuit), transformer circuit, rectifier circuit and smoothing circuit as shown below.

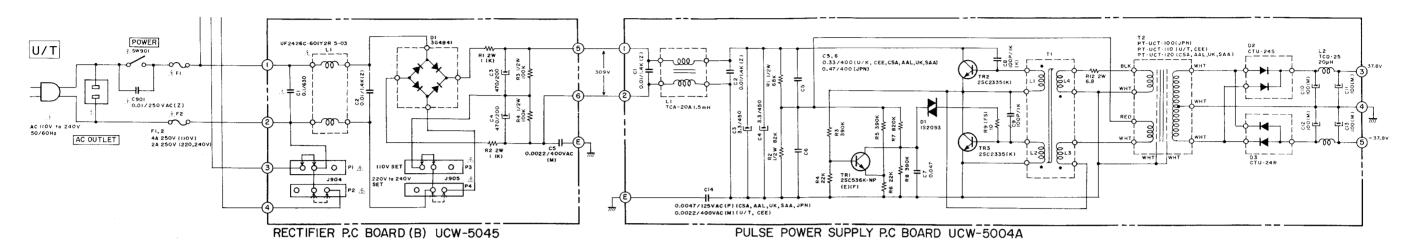

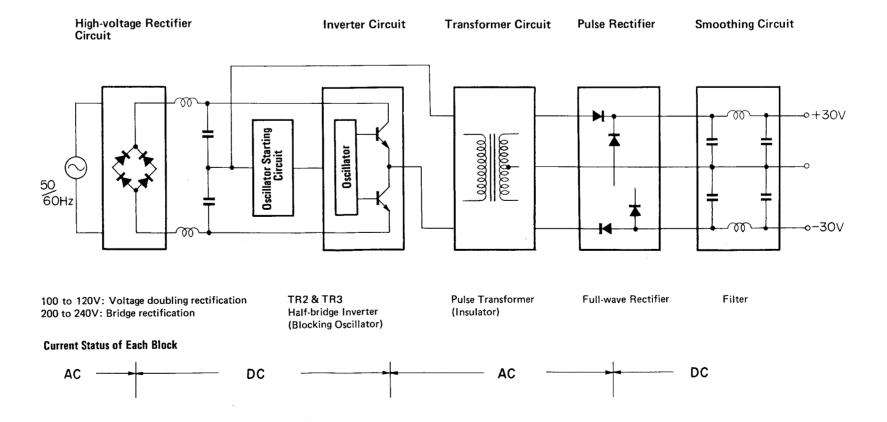

Fig. 4 Schematic diagram for power section

1. HIGH-VOLTAGE RECTIFIER CIRCUIT

Either the voltage doubling rectifier system, or the bridge rectifier system is selected according to the difference in the power supply voltage. That is, voltage doubling rectification is adopted for input voltage of 100 to 120V (for the U.S. Canada and Japan), while bridge rectification is adopted for those of 220 to 240V (for Europe, etc.), to obtain a DC voltage of approximately 300V.

Voltage and Current Characteristics

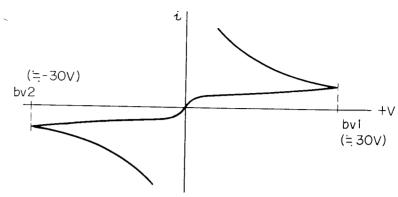

Fig. 6 Diode characteristics

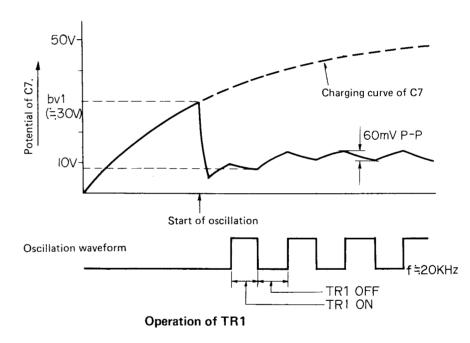

Fig. 7 Operation of TR1

2. OSCILLATOR STARTING CIRCUIT

At power switch-on, this circuit creates an initial pulse which starts the inverter circuit of the next stage. D1 is a double-directional trigger diode that quickly turns on when the voltage at both ends exceeds the breakover voltage (approx. 30V) as breakdown voltage flows through it. When the potential of C7 is raised to about 30V by switching-on the power, it will cause a positive trigger pulse to be applied to the base of TR3, thereby starting oscillation.

During oscillation, 20 kHz and 300 Vp-p square waves will appear at the intersecting point of TR2 and TR3, so that TR1 will repeat the 20 kHz switching operation. That is, the potential of C7 will be discharged when it is turned on, whereas C7 will be charged when turned off. For this reason, the potential of C7 will not reach the break-over voltage of D1, as can be seen from Fig. 7, so that D1 will be in a high-impedance state. And the operations of these circuits are absolutely unrelated to those of other circuits.

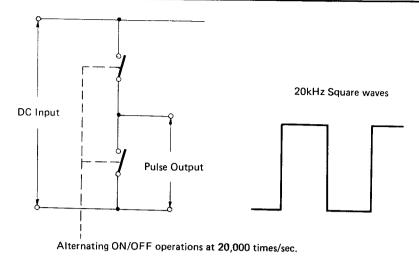

Fig. 8 Principle diagram of inverter

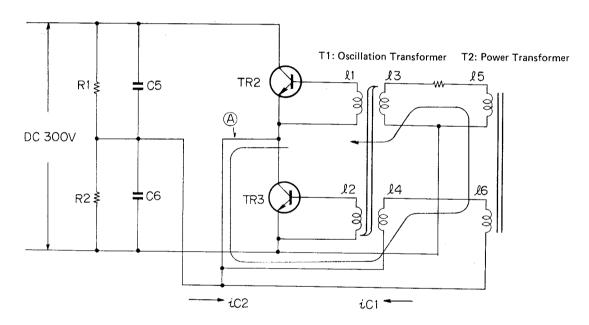

Fig. 9 Basic schematic diagram

3. INVERTER CIRCUIT (BLOCKING OSCILLATOR CIRCUIT)

This circuit functions to convert DC voltage into pulsating alternating voltage. By turning on TR2 and TR3 alternately, it causes pulse (square waves) to be generated at the intersecting point of TR2 and TR3. The 300V is divided into 150V and applied to the mid-point of C5 (R1) and C6 (R2). (This will be referred as the mid-point hereinafter.)

First, a trigger pulse is applied to the base of TR3 by the oscillator starting circuit. This causes TR3 to turn on and a collector current iC2 to flow in from the mid-point. Since this current flows from £6 to £4, current will also be induced in £5 and £3. Therefore, this current will be fed back to coil £2 of TR3's base, following flux variations in T1 (Troidal trans-

former) which accompany current variations in \$3. As this loop is formed in a direction that realizes positive feedback, collector current ic2 will continue to increase with the increase in the base current of TR3. As a result, the current flowing through £3 will also continue to increase, causing the flux density to become higher and to eventually reach saturation after the passage of a certain time. When the flux saturates so that the flux no longer varies, the £3 to 22 loop will be disconnected as a result. However, even after this positive feedback loop has been disconnected, collector current ic2 will continue to flow for a while, due to the action of the counter electromotive force that works in the direction that permits continued current flow. But, soon, the collector current will start to decrease rapidly.

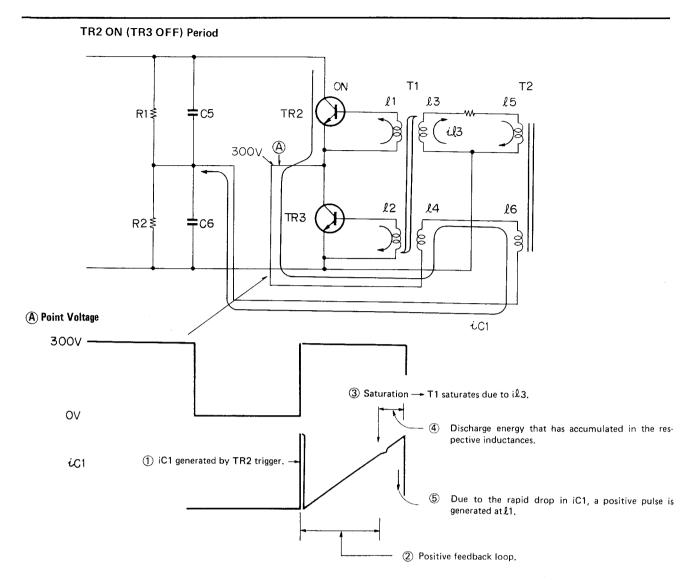

Fig. 10 TR2 turn-on period

During the above process, TR3 will be turned on, while TR2 will be "cut-off". This is because coil $\ell 1$ of TR2's base is wound in a direction opposite to which $\ell 2$ is wound, so that an inverse-direction voltage will be induced for TR2's base-emitter potential V_{BE} . For this reason, the potential of the intersecting point of TR2 and TR3 will become "0"V. When iC2 starts to decrease rapidly, the resultant flux variation will cause a positive pulse to be generated at $\ell 1$, which, in turn, will cause TR2 to turn on and TR3 to be cut-off.

Likewise, when the collector (emitter) current iC2 flows in the order of &4 to &6 to mid-point, it will cause a positive feedback loop of &6 to &5 to &3 to &4 to be formed, so that a process similar to that just described will take place.

TR3 ON (TR2 OFF) Period 300V OFF T2 lЗ l5 TR2 **‡**C5 R1 ≸ il3 **(A)** OV. 150V ON 12 14 l6 TR3 R2 ≸ **‡**C6 g . T2 input voltage. iC2 150Vp-p square, wave (A) Point Voltage 300V-٥v Due to i£3, flux density of T1 will saturate and loop will be disconnected. 1 Trigger input to TR3's base. As each coil will try to continue to conduct current even after flux saturates, a counter electromotive force will work, and iC2 will continue to increase il2 for a while. Because of the rapid drop in iC2, a positive trigger pulse that causes TR2 to turn on will be generated Due to the increase in iC2, an £6, £5, £3, £2 positive feed back loop is formed to let iC2 increase further.

Fig. 11 TR3 turn-on period

In this way, TR2 and TR3 will be alternately turned on again and again, causing square waves to be generated. Fig. 11 gives the waveforms appearing at the respective sections during the serial process.

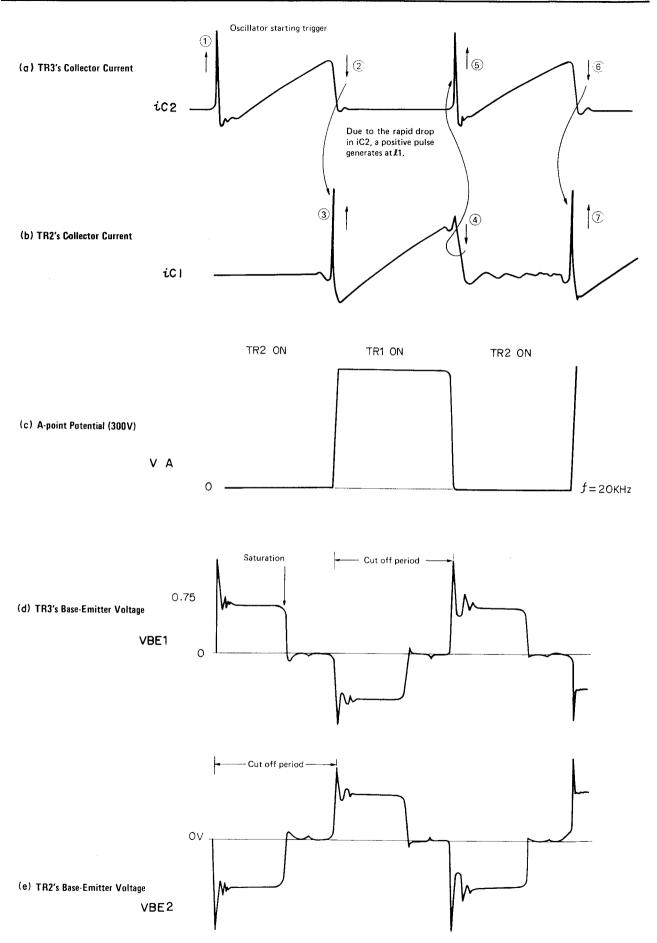

Fig. 12 Summary of waveforms appearing at each section

As shown in (d) and (e), the waveform of the baseemitter voltage of TR2 and TR3 will become "0"V upon saturation of T1's flux. In the meantime, the base current will flow in the direction similar to that before saturation, because of the counter electromotive force.

Meanwhile, by having a negative feedback applied at the high frequency range, the capacitor provided between the collector and base of TR2 and TR3 will function so as to hold down the wave height to an adequate level to prevent the peak values from rising above the maximum ratings of the respective transistors.

The oscillating frequency of this circuit is determined by such factors as the maximum flux density of T1 and the current flowing through &3. It is ordinarily designed to be approximately 20kHz.

4. TRANSFORMER CIRCUIT

Although it is based on the same principle as that applied to general power transformers, the core material has been changed into ferrite material from the conventional electrical steel plate material to match the input waveform (square wave of approx. 20kHz). Owing to the high permeability and use of high frequencies, power loss is far less, than with conventional transformers. Therefore, it permits miniaturization of circuitry, which is the advantage of using a pulse power supply.

At the same time, the transformer circuit functions to insulate the secondary-side chassis potential from the AC input potential applied to the prime side.

5. RECTIFIER CIRCUIT

Although this is a full-wave rectifier circuit intended for use with both plus and minus power supplied, it employs first recovery diodes having a quick reverse recovery time (trr) to enable high-efficiency rectification of square waves. Ordinary rectifying diodes cannot be used in this circuit.

6. SMOOTHING CIRCUIT

Because of the high frequencies, it enables direct current having a low ripple factor to be obtained with a small-capacity electrolytic capacitor. Since it has to handle square waves and impulsive triggers, and because of large number of harmonics, the pulse power supply is formed into an LPF (smoothing circuit employing a choke coil. At the same time, to avoid interference caused by radiation and induction of electromagnetic waves, the pulse power circuit, excluding the high-voltage rectifier circuit, is enclosed in a shield case to ensure sufficient shield-off. Packing used for the shield case is made of conductive material if it has been damaged during servicing or for other reasons, it must be replaced with new packing. Otherwise, undisirable radiation from the damaged part may cause noise to generate in other circuits.

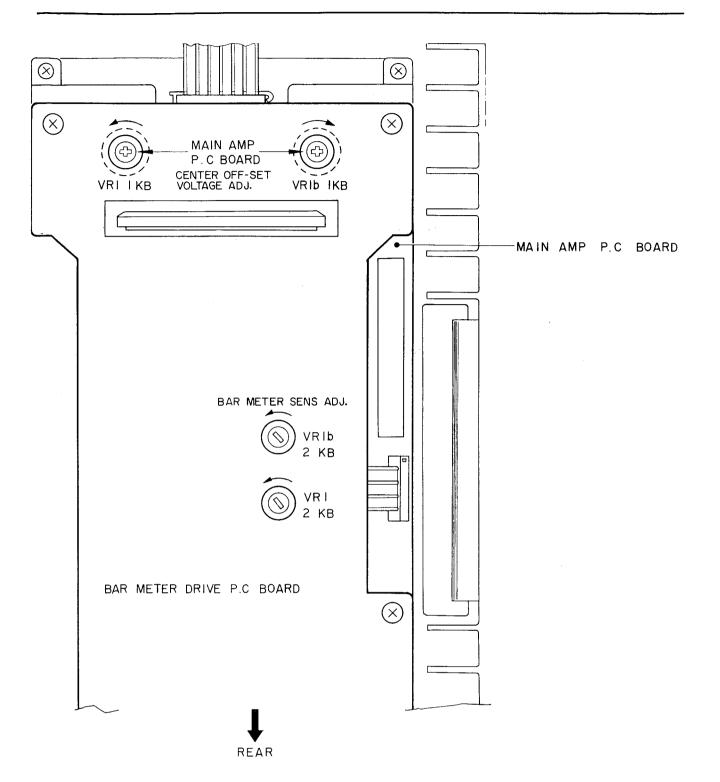

Fig. 13 Adjustment Points

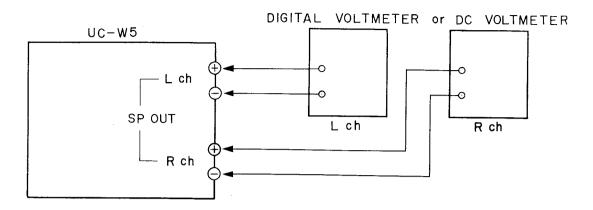

Fig. 14 Instrument Connections

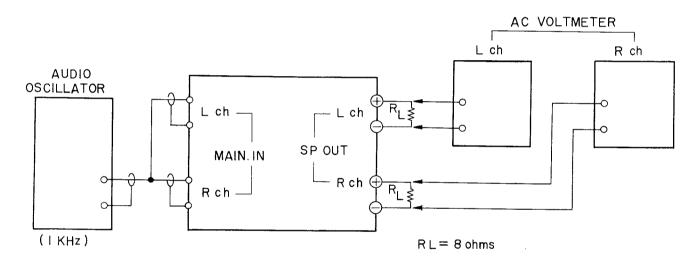

Fig. 15 Instrument Connections

1. CENTER OFF-SET VOLTAGE ADJUSTMENT (Refer to Figs. 13, 14)

Connect the Digital Voltmeter or DC Voltmeter between SPEAKER terminals.

Adjust the VR1 (L-ch), VR1b (R-ch) on the Main P.C Board so that Voltmeter reads 0±50 mV.

2. BAR METER SENSITIVITY ADJUSTMENT (Refer to Figs. 13, 15)

Connect load resistors (R_L =8 ohms) to the SPEAK-ER terminals, and input a sine wave of 1 kHz to the INPUT terminal.

Control the input signal level until the voltmeter connected to both ends of the load read 8.9V.

Under this condition, adjust VR1 (L-ch), VR1b (R-ch) on the Bar Meter Drive P.C Board so that the Bar Meter indicates 10W.

Resistor and Capacitor which is not listed in this parts list, please refer to COMMON LIST FOR SERVICE PARTS.

HOW TO USE THIS PARTS LIST

- 1. This parts list is compiled by various individual blocks based on assembly process.
- 2. When ordering parts, please describe parts number, serial number, and model number in detail.
- 3. How to read List

- 4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of Components of the Schematic Diagram or Service Manual.
- 5. Please utilize separate "Common List for Service Parts" for Resistor Parts orders.
- 6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board:
- 7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.
 - It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
- 8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

- CAUTION: 1. When placing an order for parts, be sure to list the parts no, model no., and description. There are instances in which if any of this information is omitted. parts cannot be shipped or the wrong parts will be delivered.
 - 2. Please be careful not to make a mistake in the parts no. If the parts no. is in error. a part different from the one ordered may be delivered.
 - 3. Because parts number and parts unit supply in the Preliminary Service Manual (Basic Parts List) may be partially changed, please use this parts list for all future reference.

WARNING: ⚠ INDICATES SAFETY CRITICAL COMPONENTS, FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURERS RECOMMENDED PARIS

AVERTISSEMENT: A IL INDIQUILLES COMPOSANTS CRITIQUES DE SURETE, POUR MAINTENIR LE DEGRE DE SECURATE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE OUTEP ON DES PIECES RECOM-MANDEES PAR LE FABRICANT.

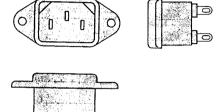

AC INLET SYSTEM

This model is equipped with an AC INLET SYSTEM. Please refer to the AC INLET SYSTEM CHART below for the specific type. By the AC INLET SYSTEM, AC (mains) cord can be connected to and disconnected from the model because the model is provided with socket exclusively for AC (mains) cord on its main body.

Please note, however, that certain models are not equipped with this system and has a built-in AC (mains) cord as before.
